

**NEW AND RARE SPECIES OF LEPIDOPTERA IN LITHUANIA,
REPORT OF 2025***POVILAS IVINSKIS*¹, †*JOLANTA RIMŠAITĖ*¹Nature Research Centre, Akademijos 2, Vilnius Lithuania, E-mail: entlab@gmail.com,**Introduction**

New data on Lepidoptera found during the research in Lithuania in 2025 are presented. This paper presents new faunistic data, including records of two species newly reported for the Lithuanian fauna, as well as information on the distribution of some rare and alien species and species listed in the Red Data Book of Lithuania.

Material and Methods

The main data was collected during field investigations in 2025 by the authors and by J. Krikštanavičienė and A. Krikštanavičiūtė (J.K., A.K.). Various entomological methods were used for collecting specimens: light trapping with automatic traps with 160W mixed light lamp, 300W solar-type lamps, UV strip, pheromone lures, wine, plant mine collecting, sweeping with entomological nets. The material was identified using identification guides: Bengtsson *et al.* (2008), Bengtsson & Johansson (2011), Aarvik *et al.* (2009). Data on distribution and faunistics follows Aarvik *et al.* (2017, 2021), Ivinskis & Rimšaitė (2018). Taxonomical treatment and distribution follow Aarvik *et al.* (2017, 2025). The specimens are deposited in the author's collection. Species new to Lithuanian fauna are marked in the text with an asterisk (*).

Discussion

Two species of Lepidoptera, *Cydia conicolana* (Fig. 1) and *Scrobipalpa clintoni* (Fig. 2), are reported for the first time in Lithuania.

Cydia conicolana is widely distributed in Europe but is generally rare and local. It is known from Sweden and Denmark, and was recently recorded in Latvia (Savenkov, *pers. comm.*). The caterpillars feed on seeds inside the cones of *Pinus* species. Adults fly high around the crowns of host trees (lepiforum.org).

Scrobipalpa clintoni is distributed in Norway, Sweden, Denmark, Germany, the British Isles, Estonia, Latvia, Belarus, Ukraine, and Russia (Gregersen & Karsholt, 2022). Larvae develop inside the stems of *Rumex confertus*, *R. obtusifolius*, and *R. crispus*. Our findings

in the stems of *R. confertus* confirm this information. These moths have two generations per year; exuviae and pupae of both generations can be found together within the stems. Examination of host plant stems showed that *S. clintoni* is abundant in the locality studied. Investigations in Dukstyna (2022–2024) revealed that *Rumex* plants do not form stems every year. In the Klangiai locality, larvae were also found in leaf stems, but the species will only be identified and confirmed after breeding.

For many moth species listed here, new data on their distribution in Lithuania are provided. The species *Conistra erythrocephala* was collected for the first time in Vilnius region. For species such as *Idaea ochrata*, *Noctua interjecta*, and many others, new distribution data are also presented. These species are not rare in suitable habitats. It is assumed that the species *Idaea ochrata*, *Isturgia arenacearia*, and *Peribatodes secundaria* are spreading in Lithuania. A large migration of *Mythimna l-album* and *Phlogophora meticulosa* was observed this year. The species *Noctua interjecta*, *N. interposita*, *N. comes*, and *N. janthe* are locally common.

Papilio machaon and *Lycaena dispar* are protected species included in the Lithuanian Red Data Book (Rašomavičius, 2021).

Coleotechnites thujaella and *Argyresthia thuiella* appear to be spreading in Lithuania; *C. thujaella* has caused significant damage to tree branches in some areas.

New data on *Cydalima perspectalis* are also presented in this paper. In some localities, this invasive species has altered the plant composition. *Buxus* shrubs, widely planted as ornamental plants in cemeteries and gardens, have been severely damaged. In 2025, *Buxus* plants in the Romainiai cemetery disappeared completely, while those in the Kairėnai and Rokantiškės cemeteries were heavily damaged. Various levels of damage were also observed in the Vilnius city center, Gvazdikai, and Kalniškės. In contrast, *Buxus* shrubs in the Stirniai cemetery remained undamaged. This year, at least two generations of *Cydalima perspectalis* were observed. As *Buxus* plants suffer severe damage, ornamental *Taxus baccata* should be considered as a replacement, since it currently has no known natural enemies in Lithuania.

Nauji duomenys apie retas ir naujas Lietuvos faunos drugių rūšis, 2025 metų pranešimas

P. IVINSKIS, †J. RIMŠAITĖ

Santrauka

Straipsnyje pateikiami duomenys apie dvi naujas drugių rūšis - *Scrobipalpa clintoni* išauginta iš *Rumex confertus* stiebu, o *Cydia conicolana* vienas individas išaugintas iš *Pinus sylvestris* konkorėžių. Taip pat pateikiami stebėjimo duomenys apie retas Lietuvos faunos drugių rūšis. Rūšys *Coleotechnites thujaella*, *Cydalima perspectalis* pastebimai plinta ir daro apčiuopiamą žalą tujoms ir buksmedžiams.

Aptiktos drugių rūšys *Papilio machaon*, *Lycaena dispar*, įrašytos į Lietuvos Raudonąją knygą. Daugelis surinktų duomenų papildė žinias apie rūšių paplitimą Lietuvoje. Dalis retų drugių priskiriami rūšims migrantams. Siūloma Lietuvoje vietoje stipriai pažeidžiamo buksmedžio plačiau auginti neturintį natūralių kenkėjų europinį kukmedį (*Taxus baccata*).
